

AU-B001 PROJECT CONTEXT

Purpose

AU-B001 is an experimental "beacon" website hosted at:

<https://assembleutopia.com>

The website behaves as an autonomous transmission node rather than a conventional webpage.

Visitors are treated as "encounters". Every access is recorded and archived.

Current Architecture

Platform

- Windows 10
 - Node.js v24
 - Express
 - Cloudflare Tunnel
 - Domain: assembleutopia.com
-

Startup Requirements

The system requires TWO processes:

1. Express server

Executed inside:

C:\AU-B001

Command:

node server.js

Listens on:

<http://localhost:8080>

2. Cloudflare tunnel

Command:

```
cloudflared.exe tunnel run au-b001
```

Cloudflare routes:

```
assembleutopia.com → localhost:8080
```

Both processes must be active for the website to function.

Startup Automation

A BAT file was created to launch both server and tunnel automatically.

Goal:

Eventually start AU-B001 automatically with Windows.

Main Concept

Every request is considered an encounter.

Current output format:

Newest encounter first.

Previous encounters are displayed below.

The site is intentionally plaintext.

Archive

Archive file:

```
encounters.json
```

Functions:

```
loadArchive() saveArchive()
```

Each new request:

1. Loads archive.
2. Creates encounter.
3. Appends encounter.
4. Saves archive.
5. Displays current encounter.
6. Displays previous encounters in reverse order.

Encounter Structure

Current fields:

- beacon
- status
- cycle
- utc
- entropy
- origin
- blueprint
- message

Example:

```
{ "beacon": "AU-B001", "status": "TRANSMITTING", "cycle": 113, "utc": "2026-06-14T01:46:53Z",  
  "entropy": "6dfcaf3f...", "origin": "46.150.67.215", "blueprint": "Mozilla/5.0 (Windows NT 10.0; Win64; x64)...",  
  "message": "SIGNAL PERSISTS" }
```

Discovered Visitors

Human operators.

Mobile devices.

Googlebot:

66.249.69.xx

Googlebot discovery occurred unexpectedly shortly after deployment.

The archive acts as an observatory of responding entities.

Atmospheric Terminology

Possible field names:

VISITOR ORIGIN

DEVICE SIGNATURE

USER BLUEPRINT

AUTONOMOUS RECONNAISSANCE DETECTED

KNOWN OPERATOR DETECTED

MOBILE RELAY DETECTED

EXTERNAL TERMINAL DETECTED

SIGNAL PERSISTS

Future Ideas

Classification system

Detect:

Googlebot Bingbot Applebot Discordbot TelegramBot YandexBot AhrefsBot SemrushBot

Generate different messages depending on entity.

Hidden page

Possible:

/archive

or

/observatory

or

/internal

Visual layer

Maintain plaintext output while adding atmospheric styling.

Statistics

Total encounters.

Unique origins.

Unique blueprints.

Entity types.

Most recent encounter.

Git Integration

Create:

GitHub repository:

AU-B001

Local repository:

C:\AU-B001

Future workflow:

git add . git commit -m "..." git push

Important Design Principle

AU-B001 is not a traditional website.

It is a beacon.

The server records responses to its transmission.

Visitors are encounters.

Bots are autonomous entities.

The archive is an observatory.

The signal persists.
